Dynamic solar protection

Using dynamic solar protection means that you can seamlessly adjust the level of light transmission to achieve the best level of comfort - regardless of the time of day, or the time of year. We can offer LEIAB products with the dynamic glass ConverLight® by Chromogenics. This high-tech product uses an electric current to achieve this seamless transmission adjustment.

The greatest benefit of using dynamic solar protection is the high level of comfort that comes from being able to adjust the level of sunlight coming in, depending on the day. On a cloudy day you want to maximize the intake of natural light, while on a hot and sunny day you can lower the light intake to a minimum in order to keep the heat out. This means reduced costs for air conditioning, and eliminates the need for adding fixed solar protections such as blinds or awnings. In our reference section you can find inspiration from the products supplied to the Balder school in Sweden.
